

LIGHTNING ROUND

# AWS re:INVENT

## This Is My Architecture: Most Innovative Storage Solutions

November 28, 2017

AWS  
re:Invent

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

This is your chance to learn directly from top CTOs and Cloud Architects from some of the most innovative AWS customers. In this lightning round session, we'll have an action-packed hour, jumping straight to the architecture and technical detail for some of the most innovative data storage solutions of 2017. Hear how Insitu collects and analyzes data from drone flights in the field with AWS Snowball Edge. See how iRobot collects and analyzes IoT data from their robotic vacuums, mops, and pool cleaners. Learn how Viber maintains a petabyte-scale data lake on Amazon S3. Understand how Alert Logic scales their massive SaaS cloud security solution on Amazon S3 & Amazon Glacier.

## Complete set of data building blocks

AWS  
re:Invent

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

## What's in store...

7- to 10-minute highly-technical presentations

- **Alert Logic** – ingestion, storage & analytics
- **iRobot** – analyzing IoT data
- **Celgene** – application migration
- **Viber** – building a data lake
- **Insitu** – data at the edge

Alert Logic

## Scalable Ingestion, Storage & Analytics

Paul Fisher

Technical Fellow

## About Alert Logic

Alert Logic provides fully managed security monitoring and protection for cloud-deployed applications and workloads

- Intrusion detection
- Web attack detection and blocking
- Vulnerability scanning
- Asset analysis and configuration assessment

**AWS**  
**re:Invent**

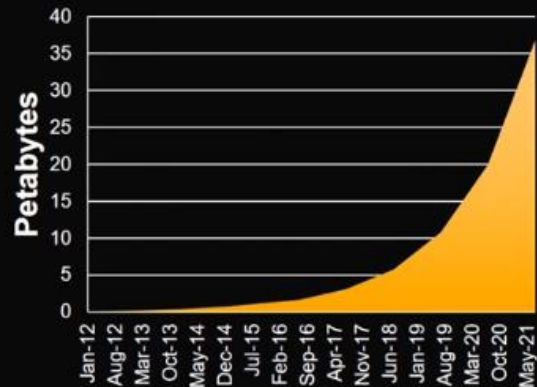

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

# The problem we faced

## Doing this produced a large data-processing problem

- 4,100+ customers
- 1.2M messages/second
- 2 petabytes per month
- 3 months to 7 years retention
- Adding 110 percent data volume/year

**AWS re:Invent**

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

## Key architecture challenges

- Achieving performance, durability, and availability, all at once, is hard
- Providing multi-region availability with Recovery Time Objective (RTO) of 15 minutes
- Designing for scale up 150x to 10PB per day for 100k customers
- Doing this all for less than \$0.02 per GB, with a team of 20 engineers

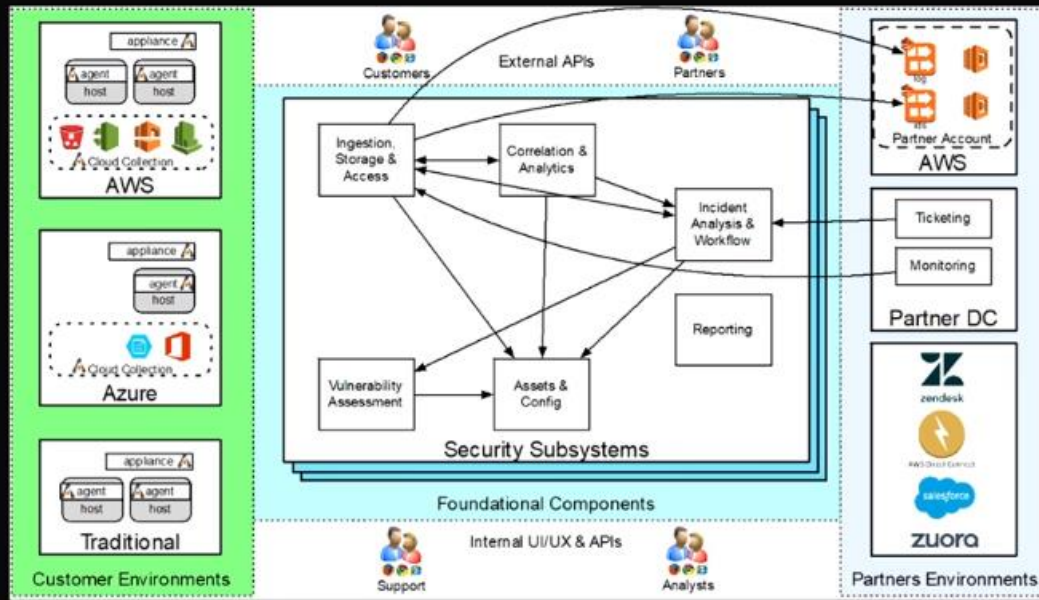

**AWS re:Invent**

The left side of the diagram shows 2 AWS regions each with a set of S3 buckets for each data type that is being stored. The buckets are then arranged so that we put 950 customers per bucket because we need to do retention periods on a per customer basis. So, we write 950 life cycle rules for each customer per month so that we can expire the data after a month, you also write storage class tiering rules that allows us to be able to tier down the data into infrequent access, in the backup region, we then write that data to infrequent access directly and then tier it down to Glacier.

Those Rules all pivot around 2 Tags, the top Rule on the right is a specific customer's expiration rule and the bottom segment is the storage tiering rule for the primary region. The regions have customers as primaries and the data bi-directionally replicate. There is also a set of KMS keys, one per data type that is generated. We then use that to generate data keys that are used to encrypt all the data. the primary region uses the backup region's KMS keys to generate a data key. All those data keys are written so that we have one key per customer per month (to reduce the blast radius of an encrypted key to just one customer for one month), those keys are written in the primary region. We then use CRR to replicate all of the data files and the key files over to the backup region.

At the same time, there are DynamoDB tables that keep track of the buckets that are being created for a given data type and the customers signing in into those buckets. We then have those data also replicated in equivalent DynamoDB tables in alternate regions. This means that in cases of downtime, we can just redirect traffic to the backup region and start servicing requests as if nothing happened. This is our disaster recovery strategy and our active-active architecture.

The diagram illustrates the AWS architecture for Global IWS Production. It shows the flow of data from the Global Data Account (us-west-2) through the Global IWS Production environment, which includes components like ingest, search, analytics, and dmngmt. The data is then processed through Analysis and Schedule components, resulting in a Bundle of data files. The architecture is spread across multiple AWS regions, including us-west-2 and us-east-1.

## Evolving the Data Store Supporting IoT Historical State Changes

**Senior Cloud Solution Architect – Product IT**

We are going to see a part of iRobot's IoT workload for big data analytics flow of their Roomba data

# The problem...

- We needed a facility to support ad-hoc queries, through an API to report historical states for AWS IoT Thing Shadow attributes.
- Our initial design pattern was based on Amazon Elastic Map Reduce, Spark Streaming, Amazon DynamoDB, Amazon API Gateway, and AWS Lambda
- DynamoDB became costly for this use case, and we needed to find an alternative solution to meet cost and performance expectations.

**AWS re:Invent**

## Key Architecture Considerations

Focused on AWS  
Managed Services

Balance  
Performance & Cost

Minimize  
DevOps impact

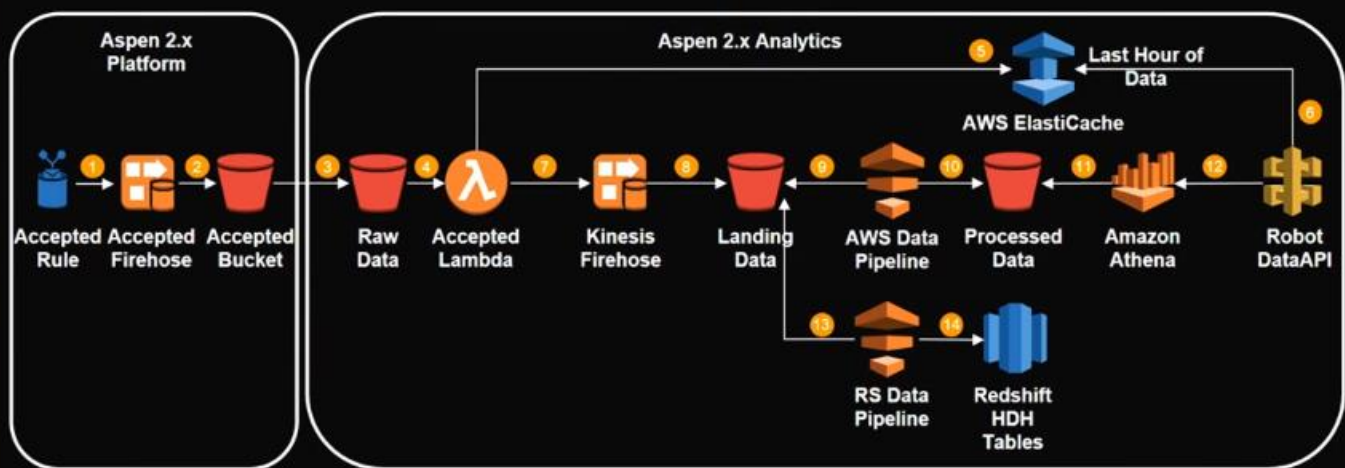

**AWS re:Invent**

© 2017, Amazon Web Services, Inc. or its Affiliates. All rights reserved.

DynamoDB was the single largest cost component of the old system

# iRobot Analytics Architecture

We are using Rules created in **AWS IoT** to trigger off actions in places like **Kinesis**. This production workload is designed to support 2 major use cases, the first is to support our customer support staff for customer issue resolutions by having the historical state of their device available when needed in real time through **AWS ElastiCache** path to the Robot API.

## Big Data @ Viber

- Close to 1 billion users worldwide
- Globally used in 230 countries
- 10-15 billion events daily (2 TB)
- 300,000 events per second (peak hours)
- 5 PB of data stored on S3/Glacier
- NoSQL DB (Couchbase) performing 2 million TPS on 20TB of data with 35 billion keys

# Viber – Big Data Architecture

## Use Case: S3 Performance

### Challenge:

- Over 300 different event types with large throughput variance
- Storm data processor created many small files, especially for lower throughput events
- Events are stored in Hive partitioned folders (Y/M/D/H) which are not optimal for S3
- Running a query over these events using Presto could generate up to 15K tps on a single S3 bucket resulting in 5xx errors and throttling the whole bucket for other processes

## Use Case: S3 Performance

### Solution:

- Concatenate small files into large files, optimally 100MB+
- Convert files into columnar file format such as Parquet or ORC

## Use Case: S3 Performance

### Future Solution:

- Concatenate & convert files in a single process (Glue?)
- Use better partitioned hive directory format (H/D/M/Y instead of Y/M/D/H)
- Use even larger files for high throughput events

INSITU Inc., a Boeing Company

## INEXA Cloud—Answers at the Edge

Rahul C. Thakkar, Director, Commercial Cloud

Steven Hoffert, Lead, Special Projects

## Yes Problemo!

- We are in the middle of nowhere – no Internet, think Australian Outback, an open-pit mine, a collection of gas well heads, linear infrastructure like pipelines
- We want to build an accurate (under 10 cm/pixel) 3D (or what we also call 2.5D) model - Why? Because our clients want our spatio-temporal algorithms to find what, if anything is broken
- We get 30+ TB of data for that location, we may have many many such locations operational globally

### Problem

- We want to verify that the data we collected on that day was decent on the ground at the “edge”
- We want that data to reach our cloud for further and continuous future processing

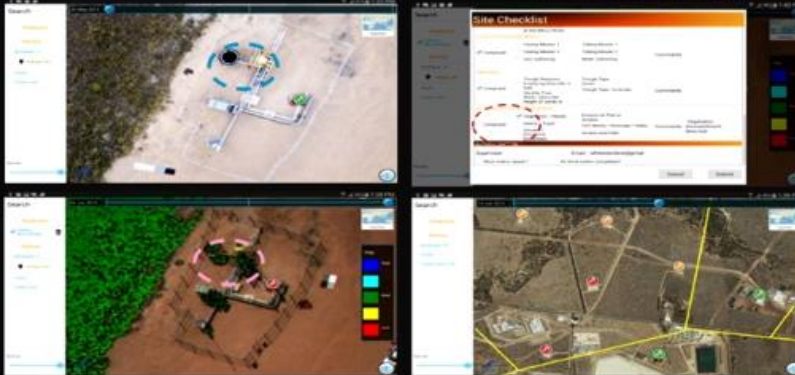

# Is my data good? How to I move it?

1

# INEXA Cloud

INSITU  
INEXA CLOUD  
AWS SNOWBALL EDGE  
BG&O 2017

SH & RT

Start it up

It's Working!  
It's Working!!

```
Command Prompt

* -i, --ip
  The IP address of the Snowball Edge (or the leader node of
  cluster). This can be found on the E Ink display.
* -m, --manifest
  The path to the manifest file. This can be downloaded from the AWS
  Console or retrieved from the job management API.
* -n, --nodeId
  Use this option to provide the node id of the new node.
* -u, --unlockcode
  The code used to unlock the appliance or cluster. This can be
  downloaded from the AWS Console or retrieved from the job
  management API.

:\INSITU RnD Tools\data\snowball-phase3>snowballEdge unlock -i 192.168.0.106 -m snowball_edge_manifest.bin -u b2b5d-ef1e7-96727-c39d6-f48d9
The Snowball Edge unlock status is: UnlockSnowballResult(status=UNLOCKING)

ompleted 16.3 MiB/~17.9 MiB with ~12 file(s) remaining (calculating...)
```

Done!

0. We ordered the Edge pre-loaded with INSITU software
1. We setup the Edge
2. We copied data into it to get it to Inexa Cloud
3. We pre-processed data right on the Edge
4. We validated that the data collect looks good locally!
5. We moved results into the Edge's S3 to get it to Inexa Cloud

But wait!!!

What if we have more data?

## Well... let's upload it into the Snowball's S3 for processing...

```

**Power it down and ship it... Soon your data will be on Inexa Cloud**

## New Storage Training

**aws** training and certification

### For Enterprise Storage Engineers

- Learn how to architect and manage highly available solutions on AWS storage services
- Advance toward AWS certifications
- Help your organization migrate to the cloud faster

### Online at [www.aws.training](http://www.aws.training)

- Access 100+ new digital training courses including advanced training on storage
- Deep Dives on S3, EFS, and EBS
- Migrating and Tiering Storage to AWS (Hybrid Solutions)

### At re:Invent

- Visit Hands-on Labs at the Venetian
- Attend a proctored "Introduction to EFS" Spotlight Lab on Thursday at 3pm at the Venetian
- Meet Storage experts at the Ask the Experts in Hands-on Labs room at the Venetian
