Understanding ReactJS — data hydration / initialization

Bartosz Szczeciński [Follow](#)

Aug 23, 2017 · 4 min read

At times you might want to have some information available to your application from outside sources — maybe you're embedding your application in some bigger website and want to access data that is already present (for example data of authorized user).

Passing data to the application at run time is known as “initialization”, “bootstrapping” or “state hydration”. Lets go through couple of solutions.

Important:

Please note that allowing data from outside of your application to be accessed inside of React might open you to attacks such as XSS or CSRF. Please make
